Trayport® GlobalVision PortalSM

The portal enables trading in all EEX Spot and Derivatives Market products on the Trayport® GlobalVision Trading GatewaySM. Furthermore, it enables viewing and trading of EEX market data through the integration into existing work processes, technologies and technical competences. With a new Trayport® connection solution, which includes mid-/back-office integration, risk management and support, it provides improved access to the liquidity and product innovations of EEX and permits mapping of all EEX Spot and Derivatives products with one connection. Trayport® GlobalVision reduces the system infrastructure costs by reusing the existing investments and technology. It provides improved compatibility with the new Trayport® Trading GatewaySM additions, including the Implied Price Calculator, and has a Trayport® Gold MappingSM service for all products in order to ensure a fast and easy set-up of their markets for all companies using this service.

ComTrader Connections

The ComTrader is a front-end trading application offering simple access for members wishing to trade EEX products. At the moment, the EEX Spot Market products for gas trading are offered via this access. However, there are plans to extend this connection to all EEX products for power, gas, emission allowances and coal within one year.

Shared Pro and Pro Access via Other Software Vendors

Connections for trading participants that use a third-party trading application to trade EEX products are called Shared Pro and Pro Access. Shared Access should be selected if there is a line connection to Deutsche Börse. It should also be selected if a third-party trading application or a trading application by an independent software vendor is used provided this application is connected to the Deutsche Börse trading architecture. Pro Access should be used if a third-party software which is currently not set up for the trading architecture (new line) is to be used.

Membership Fees >
